The Cygnus Donor Survey
Where philanthropy is headed in 2012

Penelope Burk

JUNE 2012
We are a generation of “I want” but I think that is slowly changing. People are beginning to realize that giving helps those who give just as much as those who receive.

The 2012 Cygnus Donor Survey is the fourth annual research study of American donors by Cygnus Applied Research, Inc., a Chicago-based company headed by author and fundraising expert, Penelope Burk. The Cygnus Donor Survey charts the recent giving experiences and future philanthropic intentions of thousands of active donors. Each edition of the survey also includes an investigation of select issues important to professional fundraisers and/or donors. For the 2012 study, donors' views were solicited on these topics:

- Monthly Giving, including its effectiveness in readying donors for major gifts;
- Sponsoring and participating in athletic-based Fundraising Events, including whether those experiences inspire sponsors to become philanthropic donors to the charities that run these events;
- Not-for-profits’ websites and the degree to which they support donors' giving intentions;
- How donors manage their philanthropic giving.

A companion survey posed the same questions to Canadian donors.

Survey Methodology

708,000 Americans and Canadians were invited to participate in an anonymous, online survey between February 6th and March 2nd, 2012. Due to the length of the questionnaire, which consisted of 88 questions, respondents were provided with a list of possible responses for most questions. However, they also had the option of offering a response not on the prescribed list, with ample space for their opinions. In addition, several questions were open-ended (no suggested responses) which generated over 15,000 comments.

The survey questionnaire was pre-tested with 3,000 respondents from Cygnus’ internal research file of active donors. The response rate for the survey (respondents completing some or all questions) was 3.2% or 15,364 American donors. The completion rate (respondents answering all questions) was 77%, or 11,900 donors. Margin of error for the survey is +/- 0.9%, nineteen times out of twenty.

Cygnus enjoys a robust participation in its national and international surveys thanks to the kind assistance of prominent not-for-profits who reach out to their active donors (those with a giving history within the previous 24 months) on Cygnus’ behalf. This year, 57 American and Canadian charities partnered with Cygnus on this project (Appendix i).

Respondents’ Characteristics

These are the characteristics of respondents in the 2012 American donor survey: 61% female; 14% are under 35 years of age, 61% are between 35 and 64 and 24% are 65 or older; household incomes varied widely given the age and employment differences in the respondent group. Of note, employed donors under 35 years of age enjoy household incomes at a level that fundraisers may not be anticipating. Again reflective of the wide age range among respondents, 25% are retired. Among employed respondents, 35%
classify themselves as "professional", including 40% of respondents under the age of 35. In keeping with the profile of respondents in web-based studies, the respondent group for the Cygnus Study is highly educated with 78% having earned at least an undergraduate degree from a college or university.

Regarding religious conviction, 47% of respondents identified themselves as "actively religious", 15% "not at all religious" and 38% "spiritual" or "somewhere in between actively religious and not at all religious". As has been found in every Cygnus study, religious conviction is one of two characteristics that produce the most dramatic differences in philanthropic behavior, the other being age.

Each of the nine regions of the United States is well represented in the 2012 Cygnus Donor Survey.

How Donors Gave in 2011

54% of respondents supported the same number of causes in 2011 as they had in 2010; but among those who gave to more or fewer causes, respondents were almost twice as likely to have increased the number of charities they supported. Young donors expanding their philanthropic interests are largely responsible for the upward trend in causes supported. However, when middle-age and older donors are compared on volume of causes, the trend towards supporting fewer causes overall remains strong. Among donors over 65 years of age, 46% supported eleven or more causes in 2011 versus only 19% of middle-age donors.

The 2011 Cygnus Survey found an improved giving performance last year with 41% of respondents indicating they gave more in 2011 than in 2010 while only 15% gave less. Even though the actual average value of their contributions in the year was more modest than for their older counterparts, young donors (under the age of 35) were more likely to have increased their giving in 2011.

Looking at results by the value of gifts they contributed in 2011, donors who gave $10,000 or more to charitable causes last year were more likely to have increased (50%) rather than decreased (11%) their overall support.

Donors who gave more last year than the year before attributed their increased generosity to two factors -- improvement in their own personal financial situation and the effort that not-for-profits made to do good work. Only the survey's oldest donors remained responsive to appeals from charities that focused on need and economic uncertainty.
Donors' Giving Intentions for 2012

Improvement in giving is, once again, predicted for donors in 2012 with 28% expecting to give more this year than they contributed in 2011 and only 7% feeling they will give less. Again, young donors were more likely to say they will give more (46%). As well, one in three donors who are actively religious will give more, which compares favorably with one in four donors who are less or not-at-all religious.

Because America’s most generous donors have such a substantial impact on philanthropy overall, fundraisers will be pleased to learn that donors in the top giving category in the Cygnus Survey (giving $10,000 or more last year) are also predicting a rise in their contributions. 25% said they plan to give more while only 11% plan to give less.

How Donors Manage Their Philanthropy

40% of respondents budget for philanthropy, but how they do it and who is most likely to do what is quite varied. Donors who identify some causes they plan to support at the start of the year while adopting other philanthropic interests as the year progresses, tend to support more causes in the end than either donors with no set plan for giving or donors whose plans are quite strict. As well, budget-setting by donors appears to advantage charitable causes. 90% of donors who set a budget for their philanthropy at the start of the year either dispersed it in full or gave more than they had planned. Only 7% dispersed less than they had planned to give.

83% of respondents said they conduct research on not-for-profits that they are considering for support and the most common way they do this is by spending time on the websites of charities in which they are interested. Some donors go to not-for-profit websites with the specific intention of making a gift online (36%); but others visit primarily to update themselves on news and recent activities of charities they favor. This latter group is definitely open to the possibility of giving, though, if they are satisfied with what they find. 32% of donors not intending to give during their most recent visit to a not-for-profit website actually followed through and made a gift as a result of what they learned.

In keeping with Cygnus’ past research that defined the tenets of “Donor-Centered Fundraising”, donors who visit charities’ websites want to know:

- what would be accomplished with their gifts should donors choose to contribute;
- what has been accomplished recently with gifts that donors have made;
- what is the latest news and current developments concerning the organization and its activities
How Donors Are Changing the Ways in Which They Give

In attempting to manage their philanthropy efficiently, donors' primary frustration is over-solicitation. Among donors who have tried to take action directly with charities who over-solicit, only one in four was satisfied with how they responded. 43% said that none of the not-for-profits they contacted reduced the number of appeals they sent. On a related question concerning how donors have changed the ways in which they give over the last five years, ”reducing or eliminating support to charities that over-solicit” was one of the top two responses among all respondents, and the single highest response among donors 65 years of age or older.

Willingness is increasing among donors to provide their email addresses to not-for-profits they support. 42% of respondents said they would actually prefer to download charitable receipts for gifts from not-for-profit websites and would be willing to provide their email addresses in order to get access to gift confirmation receipts in this manner. Only 19% were wholly reluctant to provide charities with their email addresses.

40% of survey donors have, in the last five years, shifted more of their support to not-for-profits working locally to benefit their own communities, and 36% now give more generously to charities that communicate measurable accomplishments with donated funds.

Monthly Giving

76% of American respondents have been asked at some time to join a monthly giving program, with younger donors considerably less likely to have ever been asked (66%). These statistics are considerably less buoyant than for donors in Cygnus’ companion study of Canadians, where over 90% of respondents in all age categories have been asked to become monthly donors.

Among American survey respondents who have been asked to give monthly, 29% are currently active monthly contributors and 9% are lapsed. More women than men give monthly but the value of monthly contributions by men is much more generous. Satisfaction among donors who give monthly is very high with 81% offering a rating of 6 or 7 on a 7-point scale.

Among monthly donors who have been giving long enough to have been asked to consider an upgrade in gift value, 55% felt that the increased gift amount requested was appropriate. 64% of this group agreed to the suggested increase. Retention of monthly donors is high, with only 22% having cancelled out of a monthly gift commitment after giving this way for some time.

In almost every way, monthly giving is a boon to fundraising. However, as a prospect source for major gift donors, it appears to be no more effective than other fundraising programs. Other than trusting in the security provisions inherent in making automatic
regular gifts, monthly donors say they are no more trusting of charities to whom they contribute monthly than they are of not-for-profits they support through single gifts. As well, they report being no more likely to offer either a major (cash) gift or a planned gift to a charity because they are monthly supporters. This study is not suggesting that monthly donors are poorer prospects for higher level giving, just that they are not automatically better prospects simply because their average annual giving is more generous than that of single gift donors.

Recommendations concerning monthly giving point to the possibility that the technical advantages of the program may be being showcased to donors over the philanthropic objectives of giving more generously. The report includes several recommendations for remedying this situation.

**Pledge-Based Fundraising Events**

71% of respondents have sponsored a participant in at least one athletic-type fundraising event within the last two years.

Relationship to the participant is the most influential reason to sponsor (67%) and, therefore, it is not surprising that the most common reason why sponsors stop giving this way is because the person they sponsored stopped participating in the event. However, 50% of sponsors said that the mission of the host charity was highly influential in their decision to sponsor, implying that there are things not-for-profits can do to keep their sponsors onside, even when participants fall away.

32% of event sponsors have been asked to make a direct philanthropic gift since becoming a sponsor, and 14% of them did follow through and contribute (somewhat higher among younger donors at 19%). 57% of all sponsors who went on to give philanthropically (68% for younger donors), agreed that their willingness to make direct charitable donations was positively connected to having been an event sponsor.

The timing of the Cygnus Donor Survey this year coincided with intense media focus on the Susan G Komen Foundation and their decision (later reversed) to discontinue grants to Planned Parenthood. This unintentionally produced additional information for the study. 27% of respondents who had discontinued their sponsorship said "the charity's mission is no longer aligned with my values". This was the second highest response and comments attached to this question confirmed that many respondents were specifically referencing their decision to stop supporting the Komen Foundation’s *Run for the Cure*.

37% of Cygnus Survey respondents have had the experience (within the past two years) of being registered participants in one or more athletic-type fundraising events. Satisfaction is high among event participants with only 5% indicating that they would definitely or likely not participate next year in the event in which they most recently took part.
Recommendations in this section of the report include testing the conversion of sponsors to philanthropic donors through several approaches as well as increasing willingness among participants to reach out to more sponsors by testing a targeted appeal.

**Are Fundraisers Leaving Money on the Table?**

44% of Cygnus Donor Survey respondents (53% of the survey's youngest donors) said they could have given more last year than they actually contributed. Almost 3,000 respondents who said they could have given more went on to describe the circumstances under which their giving could have been more generous. Eliminating over-solicitation and being more transparent about what is being accomplished with donors' contributions were referenced most often as things charities could do to position themselves for greater fundraising success.

**Report Recommendations**

This report includes forty observations and recommendations for how not-for-profits can improve fundraising performance by taking advantage of the findings of the 2012 Cygnus Donor Survey. Younger donors (under the age of 35) represent a particular opportunity for fundraising growth in every area covered by this year's survey. This report makes several recommendations on acquiring young donors and capitalizing on their willingness to give more generously.

As someone who has given loyally to certain organizations for many years, I would give even more if I were reminded about my cumulative giving. Often donors who make big, one-time gifts are featured and thanked, but other donors like myself who give what we can but do so year after year are not appreciated in the same way. Being reminded of how long I have been giving and what that has added up to over time would, in itself, be a new incentive to giving more.

--

Keep asking. The economy will eventually get better and the purse strings will loosen up.
